October 4 coding exercise class

Create an RStudio project in a directory with git initiated and linked to a github repo.

Download the data file "strawberry_oct4.csv" to your project from today's blackboard.

Read the data file into your environment with the variable name "strawberry".

Split strawberry into two data frames -- one for the Census rows (named "strwb_census") and one for the Survey rows (named "strwb_survey").

We are going to be working on the Value column of the Census.

Examine the Value column in strwb_census.

How does this column need to be transformed as part of data cleaning and organization before EDA can begin?
